

COMMERCIAL VEHICLE BRAKING REDEFINED

After more than two years of development and field tests, a new friction brand is now available. SYNERGY Braking Technology. This new friction has been developed to optimise the synergistic relationship between friction components and a vehicle's performance and service life.

Brake friction components are critical to safety. With heavy demands on performance, these components need to be robust and to work efficiently and effectively in all environments. SYNERGY braking has been proven on truck, trailer, bus and coach applications to provide premium braking performance and durability under all service operating conditions.

SYNERGY noun (pl) -gies the combined power of components when working together to create a whole that is greater than the sum of its parts.

All Synergy braking is tested and approved to UN ECE R90:02 by the VCA, the UK's designated type approval authority with more than 30 years experience in testing and providing certification for vehicle systems and components.

Synergy braking is designed to work in harmony with your vehicle to optimise the performance and durability. With this in mind Synergy brakes have been developed with emphasis on reducing wear without compromising quality.
